

AI Operating Model

Mat Myers | Vice President, Executive Partner

*AI transformation at scale requires **a robust operating model**, not just technology and talent.*

Gartner: [Want AI at Enterprise Scale? Start With a Robust AI Operating Model](#)

Low-maturity enterprises focus on surface activity — pilots, hires, vendor deals — while ignoring what actually enables scale: governance, decision rights, and operating discipline.

Gartner: [How to Design an AI Organization](#)

Security and Governance Is the Top Challenge for Enterprise Scale Deployment

Challenges with wide deployment of GenAI productivity assistants

Top 3 ranks v/s 1st rank

n = 360; IT Leaders, excluding unsure

H1_Q06. What are the top 3 challenges when deploying Generative AI productivity assistants more widely across your organization?

817549_C

Gartner

Focus Areas to Strengthen your AI Operating Model

- ❑ **Organization:** Structure teams, roles and collaboration models to drive effective AI execution and innovation.
- ❑ **Governance:** Establish clear policies, accountability and oversight to manage AI risks and align initiatives with strategic goals.
- ❑ **Technology:** Develop and implement adaptable platforms and engineering practices that enable scalable, reliable, safe and efficient AI deployment that enforces enterprise-specific governance policies.
- ❑ **Security, Ethics and Risk:** Integrate ethical principles, risk management and security controls to ensure responsible and trustworthy AI.
- ❑ **Data:** Build and maintain high-quality, accessible and well-governed data ecosystems to fuel AI success.
- ❑ **Workforce AI Literacy:** Drive adoption & literacy & best practice across the workforce.

AI Operating Model Considerations

Leadership and outcomes

- ❑ How should we organize?
- ❑ What business outcomes must the organization achieve and why?

Ethical Foundation

- ❑ Should we apply AI in a specific situation?

AI Life Cycle Management

- ❑ What is the AI life cycle framework?
- ❑ Where in the life cycle are governance decisions made?

Governance Decisions

- ❑ What governance decisions are needed to achieve these and by whom?

AI Governance Operating Model

815966_C

Gartner

| Organization |

***Designing an AI organization goes beyond teams and roles.
It requires clear decision rights, fit-for-purpose structures,
and empowered AI leadership.***

Gartner: [How to Design an AI Organization](#)

Organization: AI Organizational Design

Design the AI Organization

	Role:	Examples:
 Business model and strategy	CEO and BoD	Cost optimization, innovation, customer focus, new product development
 Enterprise operating structure	CEO	Centralized, hybrid, decentralized
 Operating model	CIO/CTO/ COO/AI leader	Enterprise operations, IT & BU-specific operating model
 AI organization	AI leader	AI capabilities, AI maturity
 AI team structure	AI leader	AI CoE, CoP, platform teams, fusion teams, AI council/ steering committee

Source: Gartner
BoD = board of directors; CEO = chief executive officer; CIO = chief information officer; CTO = chief technology officer; COO = chief operations officer;
CoE = centre of excellence; CoP = communities of practice
835248

Key Client Questions on AI Organization

AI Organizational Structure

- What teams and personnel are needed for enterprise to get maximum value from its AI investments?
- How should roles and responsibilities be distributed to deploy AI in my organization?
- How do I structure communities of practice and a center of excellence for AI in my organization?
- How do I build a multidisciplinary team for governing and executing AI?

AI Orchestration

- How do we leverage the skill levels of our employees to implement AI?
- How should I leverage data for AI projects?
- How should I structure AI delivery teams in my organization?
- Where can I source AI tools and frameworks to incorporate within my IT operating model?

AI Organizational Readiness

- How can we scale AI within our organization?
- What metrics and key questions do I need to ask when selecting AI vendors to meet my organization's KPIs?
- How do we structure internal communications around AI changes?
- How can we incorporate AI governance into our pre-existing framework?

Key Components of an AI Organization

Organization: Typical Role of IT in Enterprise AI Operating Model

Provide and operate AI platforms, infrastructure and engineering foundations

- ❑ Compute, storage, multitenant platform, schedulers, AI-aware orchestration, self-service catalogue and runtimes

Operationalize governance controls, trust, risk and security

- ❑ Implement TRiSM practices, embed policy guardrails, logging/audit, provenance, model validation, compliance controls

Operate incident, security and resilience practices for AI systems

- ❑ Anomaly detection, adversarial testing, observability tied to infra telemetry

Operate vendor and partner strategy

- ❑ Buy/build/partner decisions, manage ecosystem partnerships and vendor accountability for models

Serve as orchestrator and integrator across business, D&A, risk, legal and procurement

- ❑ Participating in executive AI councils, COEs and blended governance

Manage identity, authentication and secure access for AI agents and workloads

- ❑ Registration, credentials lifecycle, federation, token exchange and monitoring

Provide data engineering, data management and AI-ready data:

- ❑ Metadata, lineage, quality, active metadata and data products to fuel AI models

Organization: Centralized vs Decentralized Operating Structures

Common Foundational AI Capability Structures in High-Maturity Organizations

 Significant positive impact on "high maturity"
 Significant negative impact on "high maturity"
 Didn't show significant impact on "high maturity"

	Decentralized	Hybrid	Centralized
AI strategy			
AI portfolio management			
AI development team			
AI literacy initiatives			
AI governance			
AI data			
AI ideation and prioritization			
AI funding			
AI application development			
AI vendor management			
AI infrastructure			

n = 251; AI leaders whose organizations deployed at least one AI use case in production from high-maturity and low-maturity groups; excluding unsure/don't know/medium maturity

Q. For each of the following foundational AI capabilities, which option best describes your organization?

Source: 2024 Gartner AI Mandates for the Enterprise Survey

Note: The results were derived from the Binary Logistic Regression model, only the high maturity and low maturity samples are included in the dependent variables

CLIFFORD
CHANCE

Gartner

Gartner®

Organization: Centralized vs Decentralized Approaches

- ❑ High-maturity organizations **centralize where stakes are high and scarce, and skills must be pooled.**
- ❑ For many, this means **centralizing high-risk areas such as governance, security, and engineering**, while adopting hybrid structures in domains like infrastructure, portfolio management, and application development.
- ❑ Rather than choosing a single rigid structure, operate within a unified model where **centralization, decentralization, or hybridization are applied selectively.**

Case Study: Johnson & Johnson

Johnson & Johnson's AI journey

1st phase: Decentralized Model:

- ❑ Initially they encouraged a “thousand flowers” approach with nearly 900 use cases under exploration.
- ❑ This decentralized phase unlocked creativity but lacked coherence.

2nd phase (gradual shift): Decentralized-Hybrid Model:

- ❑ A central team controlled standards and shared assets
- ❑ Domain-specific teams in commercial, supply chain, and research were empowered to scale high-value projects such as supply chain risk prediction and sales enablement.
- ❑ Central authority where trust and compliance were essential, local autonomy where speed and domain expertise drove business value.

Organization: Best Practices

- ❑ High-maturity organizations **centralize where stakes are high and scarce, and skills must be pooled.**
- ❑ For many, this means **centralizing high-risk areas such as governance, security, and engineering**, while adopting hybrid structures in domains like infrastructure, portfolio management, and application development.
- ❑ Rather than choosing a single rigid structure, operate within a unified model where **centralization, decentralization, or hybridization are applied selectively.**

The AI leader is not a part-time role. The impact and potential of AI in organizations is transformative and requires **dedicated leadership**.

Gartner: [Your AI Needs a Boss; Appoint an AI Leader](#)

Organization: AI Leadership Recommendations

- ❑ Establish **AI leadership with accountability for AI innovation, strategy and value creation.**
- ❑ **Design fit-for-purpose AI structures by diagnosing the maturity of these capabilities** (data, engineering, people, culture, value) and aligning it to centralized, decentralized, or hybrid models that balance risk, scale, and innovation.
- ❑ **Enable scalable AI delivery by using platform engineering principles** and a team topologies approach to bridge skill gaps, manage risk and delivery, and foster business alignment across your organization

| Governance |

Governance: Centralized vs Decentralized Approaches

Centralized AI Governance:

- A senior cross-functional committee evaluates proposed AI projects
- *Risk Leaders ensure AI risks are evaluated against enterprise strategic priorities and conduct legal reviews*

Integrated AI Governance:

- Integrated into existing enterprise risk management processes, rather than stand-alone, holistic evaluations of each project.
- Existing governance expanded to account for AI specific risks

Business-led AI Governance:

- Business Units are the first line of defense in assessing AI risk and approving AI projects.
- This allows the business to take on more risk independently while evaluating use cases against predefined risk guidance.
- *Risk leaders ensure they have the proper resources to consistently evaluate AI risk (e.g., risk evaluation criteria, risk rating scales, escalation triggers).*

Governance: Expanding Traditional Data Governance for AI

Ensure Trust in AI Systems to Foster AI Adoption

- ☐ People's Trust
- ☐ Trust in Data
- ☐ Trust in AI Techniques

Establish Transparency to Reduce Risks and Build Confidence

- ☐ People Transparency
- ☐ Data Transparency
- ☐ Transparency of AI Techniques

Pursue Diversity to Enable Ethical and Accurate AI Outcomes

- ☐ Diversity in People
- ☐ Data Diversity
- ☐ Diversity of AI Techniques

Extending D&A Governance to AI-Specific Pillars

Gartner

Gartner

Uncertainty persists as the rise of AI agents, and the continuing progress in AI, may still introduce new attack surfaces and opportunities for attackers.

Gartner: [How to Respond to the 2025-2026 Threat Landscape](#).

AI Needs New Tech Measures for Managing Trust, Risk and Security (AI TRiSM)

Compromise & Threat Vectors	New to AI			
	Human Error or Compromise	System Faults	Compromises or attacks against AI entities	Malicious or Mistaken Activities
	Types of Compromise	Asset Damage or Manipulation	Altered AI behavior, AI theft	Data Compromise, Poisoning or Drift
Security & Risk Mgt. Measures	Enterprise Risk Management	Traditional Security	AI Entity Integrity (model, app, agent)	AI Data Protection & Privacy

Agentic AI increases need for Trust, Risk & Security Management (TRiSM)

AI Agents Highlight:	Key Factors Driving Need for Agentic AI TRiSM
Lack of Trust	The increasing use of AI/ML and GenAI is limited by a lack of trust in AI as a safe and ethical option for supporting critical business processes.
AI Agency	The introduction of LLM-based AI Agents with differing degrees of Agency allows AI to take actions with, or without, human intervention.
Rapid Acceleration	The rapid multiplication of AI Agents will create more need for governance than human-in-the-loop oversight can fulfill alone.
Human limitations	A Guardian Agent is a blend of AI governance and AI runtime Inspection and enforcement functions in the AI TRiSM technology framework, and uses AI techniques to oversee, control and secure the operation of AI applications and agents
Vendor Lock-In Potential	Guardian Agents must be independent from AI Agent platforms and tools and complement governance technology capabilities built into them.
Need for Versatility	A mixture of Agentic and non-agentic mechanisms will oversee/govern both Agentic and non-agentic AI output & actions

AI Trust, Risk & Security Management (TRiSM) Technology Functions

- AI Technology
- Traditional Technology
- Both

Only 8% of employees use AI frequently in ways that meaningfully improve their work

2024 Gartner Redefining Productivity Employee Survey

Introductory Training Is Not Enough

Forgetting Curve

Percentage of time it takes to lose newly learned skills or knowledge

The duration required to forget or lose newly acquired skills or knowledge

This learning decay can undermine the potential productivity benefits of GenAI unless skills are continuously reinforced through practical application.

Contextualize Training for Needs of Each Role or Persona Group

Persona Groups and Required AI Literacy Skills Levels

Source: Gartner
821222_C

Gartner

Gartner®

Prioritize Experiential Learning (70/20/10 Structure)

Provide Hands-On Training

The curriculum must implement practical experience through hands-on training. These activities allow the workforce to experience knowledge of AI in a more authentic and impactful way

Training Type	Description / Examples	Integration
Workshops and Seminars	Organized workshops, simulations, and real-world scenarios provide practical AI experience. Includes onboarding seminars for AI.	Used to introduce new tools or skills associated with Levels 2, 4, and 5.
Immersive Projects	Active engagement in immersive, hands-on projects. Examples include Hackathons (commonly used to improve AI literacy and skills) or incubator projects.	Projects are often aligned with central concepts or practical issues related to the learner's daily workflow. For example, AWS Jam offers a hands-on learning experience to build AI skills.
Mentorship	Programs that pair employees with AI specialists for ongoing support and guidance.	Provides personalized, continuous learning support, especially for employees advancing to Levels 4 and 5

Create Tiered Learning Pathways

The curriculum should be structured into multiple levels that vary depending on the organization's maturity. This approach develops a multi-level curriculum and defines personas within a target business unit.

Level	Focus / Audience	Learning Objectives & Content	Sample Courses
Level 1: AI Fundamentals	All Employees (Building a shared foundation)	Introduction to basic AI concepts. Understanding the vision for humans working alongside AI. Basic terminology and common applications.	Introduction to Artificial Intelligence Series
Level 2: Applied AI	Department-Specific Staff (Enhancing productivity)	Provides department-specific training on relevant AI tools. Focuses on how to leverage AI to enhance productivity and improve decision-making.	- Understanding Human-Agent Teaming - Human-in-the-loop Decision Making - Preparing AI-Ready Data
Level 3: Responsible AI and AI Ethics	All Employees/Managers (Ensuring proper governance)	Specialized instruction on AI ethics. Training focused on safeguarding data, ensuring privacy, and reducing bias in AI implementation.	- Applying Guardrails to AI Systems - Understanding Trust, Risk, and Security Management (TRiSM)
Level 4: AI Development and Engineering	Specialized Technical Staff/ AI Engineers (Building, implementing and managing AI systems)	Offers specialized instructions for staff involved in building, implementing, and integrating AI systems.	AI Engineering: Model Evaluation and Context Engineering
Level 5: AI Leadership	Managers and Executives (Governance and integration)	Prepares leaders to navigate AI governance , organizational integration, and algorithmic management	Managing Human-Agent Teams

Example: Customized Learning Tracks

Create Customized Learning Profiles Based on Business Value

Illustrative

Profiles	Learning outcome focus	Existing technical knowledge	GenAI business value
 The Generalist	Generalized knowledge	Low	Improved employee experience
 The Evolver	Upskilling, reskilling and/or role-specific application	Low/medium	Optionality
 The Expert	Building or delivering AI tools	High	- Process efficiencies - Improved customer experience

Source: Adapted From NinthVentures*
* Pseudonym
835506_C

Create Strategic and Ongoing Engagement (Continuous Learning Culture)

To adapt to new AI developments, organizations must foster a continuous learning culture using recognition, incentives, and robust feedback mechanisms

Component	Action / Goal
Recognition and Incentives	Recognize and reward active participation in upskilling initiatives.
Feedback Mechanisms	Provide opportunities for employee feedback on training content and delivery to ensure continuous improvement and utility to the target role.
Knowledge Management Assistance	Leverage a Community of Practice (CoP) to facilitate knowledge sharing among employees and disseminate insights from AI learners across the wider organization.
Addressing Resistance	Launch a campaign that highlights the organization's vision for humans working alongside AI as part of the overall strategy to mitigate employee resistance or fear of job loss.

Case Study: Building an AI-Ready Enterprise Workforce

MinterEllison's CIO-CHRO Partnership to Build AI-Literate Workforce and Culture (Partial Representation)		
	CIO action Take an orchestration role for AI skills enterprisewide	CHRO action Embed AI literacy in enterprisewide talent strategy
AI skills identification	- Identify foundational AI skills (e.g., prompt engineering) - Work with CxOs to identify domain-specific AI skills	- Assess gaps in skills required for AI across roles - Review existing competency models to ensure AI adoption
AI skills development	- Recommend AI training modules - Provision technical expertise for AI training/coaching - Establish external partnerships (e.g., with academic institutions, industry consortia, vendors)	- Embed AI training in broader L&D programs - Ensure training matches employees' postures toward AI - Set manager expectations for employee learning
Next: Job redesign	- Initiate CxO conversations on employee job redesign - Work with CHRO to update IT job families and roles	- Facilitate CxO conversations on employee job redesign - Update job families, litmus tests, job descriptions - Determine compensation packages for AI skills

Source: Adapted from MinterEllison 825538_C

MinterEllison

Gartner

MinterEllison's Approach to Designing an Inclusive AI Curriculum (Partial Representation)					
Design principle for an AI curriculum: Consider the broad spectrum of employees' AI learning journeys to create relevant training.					
Employee AI maturity					
	Avoid AI	Understand AI	Explore AI	Adopt AI	Champion AI
	Resist AI due to fear, misconceptions or lack of understanding; skeptical of benefits	Begin to recognize the potential benefits of AI; not yet convinced of its applicability to their work	Experiment in a risk-free environment, building confidence and reducing apprehension	AI becomes a regular part of their work processes; increased familiarity and comfort	Actively promote the benefits of AI to their peers; help others adopt AI
Multimodal learning options	- What's all the fuss about Co-pilot (solo) - Gen AI essentials (solo)	- Writing with GenAI (interactive) - Practical AI for lawyers: Harnessing ChatGPT and other GenAI models in legal practice (solo)	- Prompt activity Book.pptx (peer/team) - Minters mini hack — design thinking session with an AI challenge (interactive)	- Using AI safely: ME's guidelines, lighthouse principles (webinar) - Unlock efficiency with AI: A practical guide for business ops (interactive)	- Lead an innovation ideas exchange — LightStream, Advice Generator (interactive) - Plan a team activity/excursion using GenAI (interactive)

Next Steps

Group Discussion:

What are the next steps we need to prioritize?

Consider

☐ *AI Organizational Design & Leadership*

☐ *Governance*

☐ *Data Readiness*

☐ *Security, Ethics & Risk*

☐ *Technology approach*

☐ *Workforce literacy*

☐ *Use Case Prioritization*

☐ *Skills and Resourcing*

Assessing AI Maturity (Gartner AI Maturity Assessment)

Tier 1	 AI strategy	 AI value	 AI organization	 AI people & culture	 AI governance	 AI engineering	 AI data
Tier 2	Monitor and interpret AI trends	Develop and manage AI use case portfolio	Develop external partnerships and alliances for AI	Manage culture and change for / due to AI	Create, maintain, and evolve AI, governance policies and controls	Design and architect AI applications and systems	Acquire and prepare AI data
	Develop and rationalize AI ambition	Develop AI value propositions and business cases	Manage and balance internal and external ecosystem	Evolve roles and staffing for / due to AI	Develop AI governance operating models and teams	Develop, test and integrate AI applications and systems	Manage and govern AI data
	Develop and refine AI strategy	Develop AI product portfolios	Evolve internal operating model	Deliver skills, training, and literacy for AI	Engineer oversight systems and enforce policies	Deploy, operate and scale AI systems	Build AI data utilization and insights
	Develop and coordinate AI strategic roadmap					Manage project, platform and application portfolios	
	Innovate / incubate AI					Develop and manage AI engineering teams	

Source: [AI Maturity Assessment](#)

Typical AI Roadmap

	← Initial activities				Advanced activities →
 AI strategy	Define the AI vision	Analyze external trends	Communicate the AI strategy	Identify priorities for AI portfolio	Establish process to refine AI strategy
	Measure AI maturity	Initiate the AI strategy	Set adoption goals for AI roadmap	Measure AI strategy success	
 AI value	Prioritize initial AI use cases	Run initial AI pilots	Establish process to prioritize AI portfolio	Implement AI FinOps practices	Set up AI value monitoring system
	Define value for initial AI use cases	Track value of initial use cases	Introduce product management practices	Launch an initial AI product	Establish an AI product portfolio
 AI organization	Create an AI resourcing plan	Appoint an AI leader	Establish AI target operating model	Set up process to manage AI partnerships	
	Set up an AI community of practice	Set up an initial AI team/center of excellence	Form initial external AI partnerships		
 AI people and culture	Create an initial AI workforce plan	Create an AI change management plan	Set up process to evaluate AI workforce impact	Define business champions to drive AI literacy	
	Set up process for review of roles and job redesign	Create initial AI awareness campaigns	Launch an AI literacy program	Set up monitoring of employee readiness for AI	
 AI governance	Identify top AI risks and mitigation	Establish AI ethical principles	Set enforcement processes	Set up cross-functional AI governance board	Use AI literacy programs for AI governance
	Define initial AI policies	Gain buy-in for AI governance approach	Define decision rights for AI	Define target governance AI operating model	Pilot AI governance tooling
 AI engineering	Establish build vs. buy framework	Set up a sandbox environment	Define AI reference architecture	Establish MLOps/ModelOps practice	Design and embed AI UI/UX best practices
	Select vendors for initial AI use cases	Define library of design patterns	Create an AI vendor and application strategy	Set up an AI observability system	Stand up AI platform engineering
 AI data	Assess data readiness for initial AI use cases	Build data analytics for AI	Extend data governance to support AI	Establish an AI data quality framework	Implement data observability for AI
	Implement data readiness plan	Gain buy-in to evolve data capabilities for AI	Evolve data capabilities for AI	Adapt metadata Practices for AI	

Thank You

Mat Myers | VP Executive Partner
